PROFESSIONAL SUMMARY

Software developer with over a year of professional experience across the full **SDLC** in **Agile** teams — requirements gathering, low-level design, code development, test scenarios, debugging, and deployment. Builds and ships cloud-native services on **AWS** and **Google Cloud** using **Docker**, **Kubernetes**, **Terraform**, and **CI/CD** pipelines, alongside Android and web development in **Kotlin**, **TypeScript**, and **Python**. Delivers reliable, cost-effective solutions with a quality-focused approach, takes ownership of tasks end to end, and upskills continuously to stay current with cloud and AI tooling.

TECHNICAL SKILLS

Languages: Python, Java, JavaScript, TypeScript, Kotlin, SQL, HTML, CSS

Frameworks & Libraries: React.js, Next.js, Node.js, Express.js, REST APIs, Tailwind CSS, Jetpack Compose

Cloud & DevOps: AWS , Google Cloud, Docker, Kubernetes, Terraform, CI/CD, GitHub Actions, Git, Linux

Databases: PostgreSQL, MySQL, MongoDB, Firebase, Firestore

AI / ML: Google Gemini API, Prompt engineering, On-device machine learning

Practices: SDLC, Agile development, Requirements gathering, Low-level design, Test scenarios, Debugging, Deployment, Code reviews, Issue resolution and mitigation, Technical documentation, Quality-focused development

EXPERIENCE

Software Developer

Dec 2025 – Present

Cloudtechner

Gurgaon, India (Remote)

- Own delivery of assigned modules through the full **SDLC** in **Agile** sprints, from requirements gathering and low-level design through code development, test scenarios, debugging, and deployment.
- Containerise services with **Docker** and deploy to **AWS EKS**, provisioning infrastructure as code with **Terraform** so environments are repeatable and cost-effective to run.
- Maintain **CI/CD** pipelines in **GitHub Actions**, replacing manual deployment steps with automated builds, tests, and releases.
- Diagnose and resolve production issues, applying systematic **problem-solving** for fast issue resolution and mitigation.
- Write technical documentation for deployment and troubleshooting procedures, supporting knowledge sharing across the team.

DevOps / AI Engineer Intern

Jun 2025 – Dec 2025

Cloudtechner

Gurgaon, India (Remote)

- Converted to a full-time Software Developer role in December 2025 on the strength of internship delivery.
- Built and tested application components to specification, taking part in code reviews and Agile ceremonies alongside the engineering team.
- Automated repetitive deployment and environment-setup tasks, improving day-to-day team efficiency and reducing hand-run steps.
- Engaged in continuous upskilling across DevOps tooling and cloud services, applying each addition to live work rather than leaving it theoretical.

PROJECTS

Hands-Free

2026

Kotlin, Android, MediaPipe, CameraX, AccessibilityService, DataStore github.com/Nisanth2003/Hands-Free

- Android app that controls the phone entirely through hand gestures seen by the front camera, using **MediaPipe** 21-point hand tracking over a **CameraX** pipeline at 20–30 FPS on mid-range devices.
- Wrote a geometry-based gesture classifier instead of training a model per gesture, keeping the recogniser deterministic, debuggable, and tunable at runtime.
- Drives system-wide taps, scrolling, and Back / Home / Recents through an **AccessibilityService**, with a cursor overlay that works over any app without requesting **SYSTEM_ALERT_WINDOW**.
- Built for accessibility: dwell-to-click for users who cannot coordinate a tap gesture, a practice mode, and anti-misfire cooldowns for tremor-prone hands.

ClockAlert

2026

Kotlin, Android, Room, Geofencing, NotificationListenerService, ML Kit github.com/Nisanth2003/ClockAlert

- Android alarm app whose alarms fire on a real-world event rather than a clock time — arriving at a destination, or a tracked task finishing.
- Designed it around one scheduled alarm per trigger, refined by sparse signals the OS pushes in (geofence transitions, notification updates), so there is no background polling and no always-on location anywhere in the app.
- Guaranteed fallback: if a signal never arrives or a permission is revoked, the alarm still rings at the last estimate — degrading to an ordinary alarm instead of silence.
- **Room** persistence with exported schemas and real additive migrations, no destructive fallback, across 100+ Kotlin source files.

Portfolio Site

2026

Next.js, TypeScript, Three.js, Google Sheets API, GitHub Actions github.com/Nisanth2003/Portfolio

- Live at nisanth2003.github.io/Portfolio. Statically generated at build time from a private Google Sheet through a service account, so publishing new work is a spreadsheet edit rather than a code change or a hand-run deploy.
- Validates every sheet row at build time and fails the build with the offending row number, so malformed data can never reach production.
- Deploys to GitHub Pages automatically through **GitHub Actions**, with a committed fallback snapshot so an upstream outage cannot break a release.

EDUCATION

- Capstone project: BeWell — an Android wellness application built with Kotlin and Firebase, delivered in Agile sprints.

ADDITIONAL INFORMATION

Strengths: Ownership, Prioritisation, Deadline management, Collaboration, Communication, Proactive issue handling, Upskilling / reskilling / cross-skilling

Availability: Flexible to work in shifts; open to relocation and to working from any location

Academic standing: No standing arrears; consistent academic performance
